### Divide and conquer plan for the weather App

First, I see it important to create a small backlog to structure the tasks needed for this project and to size how much time I will need to allocate, in order to deliver by Friday. Thus I have created a set of user stories that will enable me divide the work into a set of small deliverables

#### **User Story 01 - Setup and architecture**

As a developer, I want a clean project structure and an API architecture and setup ready, so that features can be built upon

#### **User Story 02 - Home page creation with browsable cities**

As a user, I want to see default cities on the main page, so that I can directly upon launch see the weather for the major cities of Casablanca, Rabat, Marrakech, tanguer and Fes

#### **User Story 03 - City row content**

As a user, I want each city to show its name, temperature, and weather state, so that I can compare between cities

#### **User Story 04 - Add a city**

As a user, I want to be able to add a specific city, so that I can compare beyond the default cities

#### **User Story 05 - Delete a city**

As a user, I want to be able to delete a city from my list

#### **User Story 06 - Search**

As a user, I want to search my city list, so that I can find a city quickly

#### **User Story 07 - Refresh**

As a user, I want to refresh the weather, so that I see up to date conditions.

#### **User Story 08 - Tapable city and see details**

As a user, I want to tap a city so that I can see its 5-day forecast

#### **User Story 09 - Current location**

As a user, I want my current location shown first and highlighted, so that I see local weather without adding it

#### **User Story 10 - Unit tests**

As a developer, I want unit tests for the main logic, so that future changes don't break existing features

#### **User Story 11 - Documentation**

As a reviewer, I want clear project documentation, so that I can understand, run, and evaluate the app

#### **User Story 12 - Push to GitHub and deliver**

As a reviewer, I want the project on GitHub, so that I can access and review the code
