

Babel Entretien Technique

Candidat: Amine Benchekroun

Setup and Architecture Simple Documentation

Framework : SwiftUI

Data: OpenWeatherMap.org

Dependency manager: Swift package manager

Architecture pattern: MVVM

Minimum iOS version: iOS 17

API Architecture:

- APIClient: a singleton that handles everything related to the API requests
- WeatherService: handles which weather data to fetch / ask from the APIClient, and handles the conversion from the raw data into the app's models
- All API call will be asynchronous, while the ViewModel runs on the main thread

API calls:

- getCurrentWeather: get the weather of a city either by city name or longitude / latitude
- getCityForecast: get the 6 days forecast of a given city either by city name or longitude / latitude as well
